Results 1 - 5 of 5 short listing

- 1 Using high-speed WANs and network data caches to enable remote and distributed visualization 75%

Wes Bethel , Brian Tierney , Jason lee , Dan Gunter , Stephen Lau

Proceedings of the 2000 ACM/IEEE conference on Supercomputing (CDROM)

November 2000

Visapult is a prototype application and framework for remote visualization of large scientific datasets. We approach the technical challenges of tera-scale visualization with a unique architecture which employs high speed WANs and network data caches for data staging and transmission. This architecture allows for the use of available cache and compute resources at arbitrary locations on the network. High data throughput rates and network utilization are achieved by parallelizing I/O at each ...

- 2 A survey of current object-oriented databases 61%

Mansour Zand , Val Collins , Dale Caviness

ACM SIGMIS Database February 1995

Volume 26 Issue 1

Object-oriented concepts form a good basis for the data models required for next-generation database applications such as CAD/CAE/CASE/CAM systems, knowledge-based systems, multimedia, etc. Many object-oriented databases are available commercially or are being developed by industry or academic research facilities. This paper attempts to compare some of these products using fourteen criteria. The selected criteria are major factors required for the successful design of an object-oriented database ...

- 3 A structural view of the Cedar programming environment 52%

Daniel C. Swinehart , Polle T. Zellweger , Richard J. Beach , Robert B. Hagmann

ACM Transactions on Programming Languages and Systems (TOPLAS) August 1986

Volume 8 Issue 4

This paper presents an overview of the Cedar programming environment, focusing on its overall structure—that is, the major components of Cedar and the way they are organized. Cedar supports the development of programs written in a single programming language, also called Cedar. Its primary purpose is to increase the productivity of programmers whose activities include experimental programming and the development of prototype software systems for a high-performance personal computer. T ...

4 Parity logging disk arrays

35%

Daniel Stodolsky , Mark Holland , William V. Courtright , Garth A. Gibson

ACM Transactions on Computer Systems (TOCS) August 1994

Volume 12 Issue 3

Parity-encoded redundant disk arrays provide highly reliable, cost-effective secondary storage with high performance for reads and large writes. Their performance on small writes, however, is much worse than mirrored disks—the traditional, highly reliable, but expensive organization for secondary storage. Unfortunately, small writes are a substantial portion of the I/O workload of many important, demanding applications such as on-line transaction processing. This paper presents
